Bing Shopping API

API uptime 100.000%

Our Bing Shopping API allows you to scrape SERP results from Bing Shopping. The API is accessed through the following endpoint: /search?engine=bing_shopping. A user may query the following: https://serpapi.com/search?engine=bing_shopping utilizing a GET request. Head to the [playground](#) for a live and interactive demo.

API Parameters

Search Query

Required

Parameter defines the search query. You can use anything that you would use in a regular Bing Shopping search.

Geographic Location

Optional

The market where the results come from (e.g. [en-US](#)). Typically, [mkt](#) is the country where the user is making the request from. However, it could be a different country if the user is not located in a country where Bing Shopping API delivers results. The market must be in the form <language code>-<country code>. For example, en-US. The string is case insensitive. For a list of possible market values, see [Market Codes](#).

NOTE: If known, you are encouraged to always specify the market. Specifying the market helps Bing route the request and return an appropriate and optimal response. If you specify a market that is not listed in [Market Codes](#), Bing Shopping API uses a best fit market code based on an internal mapping that is subject to change.

This parameter and the [cc](#) query parameter are mutually exclusive—do not specify both.

Localization

Optional

Parameter defines the country to search from. It follows the 2-character [ISO_3166-1](#) format. (e.g., [us](#) for United States, [de](#) for Germany, [gb](#) for United Kingdom, etc.).

Pagination

Optional

Parameter controls the offset of the shopping results. (e.g., [efirst=10](#) will move the 10th shopping result to the first position).

Advanced Filters

Optional

Parameter allows usage of a more complex filtering options such as filtering by date range [ex1:"ez5_18169_18230"](#) or using a specific display filters such as [ufn:"Wunderman+Thompson"+sid:"5bede9a2-1bda-9887-e6eb-30b1b8b6b513"+catguid:"5bede9a2-1bda-9887-e6eb-30b1b8b6b513_cfb02057"+segment:"generic.carousel"+entitysegment :"Organization"](#). Exact values can be constructed by using Bing search and copying [filters](#) query parameter.

Serpapi Parameters

Required

Set parameter to [bing_shopping](#) to use the Bing Shopping API engine.

Optional

Parameter defines the device to use to get the results. It can be set to [desktop](#) (default) to use a regular browser, [tablet](#) to use a tablet browser (currently using iPads), or [mobile](#) to use a mobile browser.

Optional

Parameter will force SerpApi to fetch the Bing Shopping results even if a cached version is already present. A cache is served only if the query and all parameters are exactly the same. Cache expires after 1h. Cached searches are free, and are not counted towards your searches per month. It can be set to [false](#) (default) to allow results from the cache, or [true](#) to disallow results from the cache. [no_cache](#) and [async](#) parameters should not be used together.

Optional

Parameter defines the way you want to submit your search to SerpApi. It can be set to [false](#) (default) to open an HTTP connection and keep it open until you got your search results, or [true](#) to just submit your search to SerpApi and retrieve them later. In this case, you'll need to use our [Searches Archive API](#) to retrieve your results. [async](#) and [no_cache](#) parameters should not be used together. [async](#) should not be used on accounts with [Ludicrous Speed](#) enabled.

Optional

Enterprise only. Parameter enables [ZeroTrace mode](#). It can be set to [false](#) (default) or [true](#). Enable this mode to skip storing search parameters, search files, and search metadata on our servers. This may make debugging more difficult.

Required

Parameter defines the SerpApi private key to use.

Optional

Parameter defines the final output you want. It can be set to [json](#) (default) to get a structured [JSON](#) of the results, or [html](#) to get the raw html retrieved.

API RESULTS

JSON Results

JSON output includes structured data for Shopping Results.

A search status is accessible through `search_metadata.status`. It flows this way: `Processing -> Success || Error`. If a search has failed, `error` will contain an error message. `search_metadata.id` is the search ID inside SerpApi.

HTML Results

HTML output is useful to debug JSON results or support features not supported yet by SerpApi.

HTML output gives you the raw HTML results from Bing Shopping.
