Google Reverse Image API

API uptime 99.334%

Google Reverse Image API allows to get results for image search <https://images.google.com>. The API is accessed through the following endpoint: `/search?engine=google_reverse_image`.

A user may query the following: https://serpapi.com/search?engine=google_reverse_image utilizing a `GET` request. Head to the [playground](#) for a live and interactive demo. If you are interested in ordinary image search - head to [images](#) section.

API Parameters

Search Query

Optional

Parameter defines the query you want to search. You can also include location in a query as location parameter doesn't work for this kind of search.

Geographic Location

Optional

Parameter defines from where you want the search to originate. If several locations match the location requested, we'll pick the most popular one. Head to the [/locations.json API](#) if you need more precise control. The `location` and `uule` parameters can't be used together. It is recommended to specify `location` at the city level in order to simulate a real user's search. If `location` is omitted, the search may take on the location of the proxy.

Optional

Parameter is the Google encoded location you want to use for the search. `uule` and `location` parameters can't be used together.

Localization

Optional

Parameter defines the Google domain to use. It defaults to google.com. Head to the [Google domains page](#) for a full list of supported Google domains.

Optional

Parameter defines the country to use for the Google search. It's a two-letter country code. (e.g., `us` for the United States, `uk` for United Kingdom, or `fr` for France) Head to the [Google countries page](#) for a full list of supported Google countries.

Optional

Parameter defines the language to use for the Google Reverse Image search. It's a two-letter language code. (e.g., `en` for English, `es` for Spanish, or `fr` for French). Head to the [Google languages page](#) for a full list of supported Google languages.

Optional

Parameter defines one or multiple languages to limit the search to. It uses `lang_{two-letter language code}` to specify languages and `|` as a delimiter. (e.g., `lang_fr|lang_de` will only search French and German pages).

Pagination

Optional

Parameter defines the result offset. It skips the given number of results. It's used for pagination. (e.g., `0` (default) is the first page of results, `10` is the 2nd page of results, `20` is the 3rd page of results, etc.).

Advanced Reverse Image Parameters

Required

Parameter defines URL for an image to perform reverse search.

Advanced Filters

Optional

Parameter defines the level of filtering for adult content. It can be set to `active` or `off`, by default Google will blur explicit content.

Optional

(to be searched) parameter defines advanced search parameters that aren't possible in the regular query field. (e.g., advanced search for dates, size, etc.).

Serpapi Parameters

Required

Set parameter to `google_reverse_image` to use the Google Reverse Image API engine.

Optional

Parameter defines the device to use to get the results. It can be set to `desktop` (default) to use a regular browser, `tablet` to use a tablet browser (currently using iPads), or `mobile` to use a mobile browser.

Optional

Parameter will force SerpApi to fetch the Google Reverse Image results even if a cached version is already present. A cache is served only if the query and all parameters are exactly the same. Cache expires after 1h. Cached searches are free, and are not counted towards your searches per month. It can be set to `false` (default) to allow results from the cache, or `true` to disallow results from the cache. `no_cache` and `async` parameters should not be used together.

retrieve them later. In this case, you'll need to use our [Searches Archive API](#) to retrieve your results. `async` and `no_cache` parameters should not be used together. `async` should not be used on accounts with [Ludicrous Speed](#) enabled.

[zero_trace](#)

Optional

Enterprise only. Parameter enables [ZeroTrace mode](#). It can be set to `false` (default) or `true`. Enable this mode to skip storing search parameters, search files, and search metadata on our servers. This may make debugging more difficult.

[api_key](#)

Required

Parameter defines the SerpApi private key to use.

[output](#)

Optional

Parameter defines the final output you want. It can be set to `json` (default) to get a structured [JSON](#) of the results, or `html` to get the raw html retrieved.

[json_restrictror](#)

Optional

Parameter defines the fields you want to restrict in the outputs for smaller, faster responses. See [JSON Restrictor](#) for more details.

API Results

JSON Results

JSON output includes structured data for `image_results` - actual search results, `inline_images` containing [inline images](#) displayed and might contain `knowledge_graph` - having data from [knowledge graph](#).

A search status is accessible through `search_metadata.status`. It flows this way: [Processing](#) -> [Success](#) || [Error](#). If a search has failed, `error` will contain an error message. `search_metadata.id` is the search ID inside SerpApi.

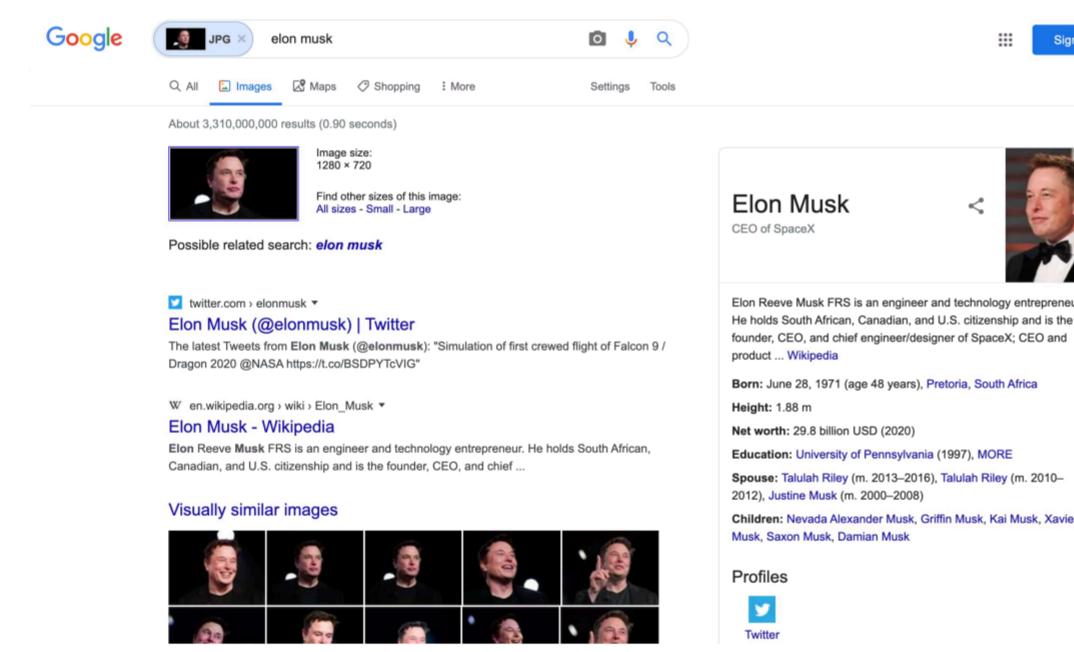

HTML Results

HTML output is useful to debug JSON results or support features not supported yet by SerpApi.

HTML output gives you the raw HTML results from Google.

API Examples

Example with [image_url](#): <https://i.imgur.com/5bGzZi7.jpg>

GET

```
1 | https://serpapi.com/search.json?
engine=google_reverse_image&image_url=https://i.imgur.com/5bGzZi7.:
```

Code to integrate

Ruby

```
1 | require "serpapi"
2 |
3 | client = SerpApi::Client.new(
4 |   engine: "google_reverse_image",
5 |   image_url: "https://i.imgur.com/5bGzZi7.jpg",
6 |   api_key:
7 | "a85853e3401522bd0dbb7b0d6b4901dc8a5849baae4354be6cea1dd229296958"
8 |
9 |
10 | results = client.search
|   inline_images = results[:inline_images]
```
