

Unlocker API

Web Unlocker API Features

[Copy page](#)

Explore Web Unlocker API's advanced features like CAPTCHA solving, Premium Domains, Headers & Cookies management, and Browser Rendering for efficient web scraping.

Disable CAPTCHA Solving

By default, as part of our full proxy unblocking solution, Web Unlocker API also solves CAPTCHAs that are encountered while returning your proxy request.

When disabling CAPTCHA solver, our intelligent algorithm still takes care of the entire ever-changing flow of finding the best proxy network, customizing headers, fingerprinting, and more, but intentionally does not solve CAPTCHAs automatically, giving your team a lightweight, streamlined solution, that broadens the scope of your potential scraping opportunities.

Best for:

Scraping data from websites without getting blocked

Emulating real-user web behavior

Teams that don't have an unblocking infrastructure in-house and **don't want** their scraper to solve CAPTCHAs automatically

[How can I get started?](#)

Web Unlocker API Premium Domains

Premium domains are a part of Bright Data's tiered website classification system. These are websites that are more challenging to unblock than others and require additional Web Unlocker API resources.

In this article, we will see the current list of Premium domains, understand how to target them, and go over the special pricing.

 The premium domains list is updated quarterly using our website classification logic and we'll notify you via email 30 days in advance of any changes to your domains. You can always access the most up-to-date list in your Web Unlocker API zone.

Current List of Premium Domains

[Expand to view current premium domains](#)

Enable Premium Domains

When creating your Web Unlocker API zone, check the 'Premium Domains' box under Special features

network and includes CAPTCHA solving, automatic retries, and fingerprint management.

With Web Unlocker, you'll never have to worry about blocks, restrictions, or CAPTCHAs. The Unlocker fully emulates a real user and works completely in the background allowing you to send unlimited concurrent requests and get back a perfect response without being blocked.

Benefits:

- Scrape public data from any website
- Bypass CAPTCHAs, blocks, and, restrictions
- Only pay for successful requests
- Automated IP address rotation
- User emulation & fingerprints

Add Proxy

Pricing

Once enabled, the premium price will be reflected in the "Estimated cost" section. Check out the [pricing page](#) to see exact numbers, but keep in mind these prices are usually for "Pay as you go" plans and you can enjoy significant discounts if you sign up to a package or talk to our sales people!

ⓘ Even after enabled, only specific requests to these domains will be priced at the higher rate. Requests to other domains will be kept at the default lower tier.

Geolocation Targeting -country-country_code

💡 Web Unlocker automatically selects the optimal IP location for targeting your domain, reducing the need for manual configuration in **most** cases. Manual geo-targeting is useful when accessing region-restricted or location-specific data.

If you want to target from a specific **country** in Web Unlocker API refer to [geolocation targeting](#).

Scrape as markdown

Web Unlocker is able to live convert your pages from HTML to markdown. This makes it easier to feed your LLM training system, for example.

To activate the feature, add the `x-unblock-data-format: markdown` header when using the native proxy interface, or set `data_format: 'markdown'` when using the API.

HTTP API Native proxy interface

```
API_KEY=your_api_key_here
ZONE=your_zone_here
curl -v \
  -H "Authorization: Bearer $API_KEY" \
  -H 'content-type: application/json' \
  --data '{"url": "https://example.com", "zone": "$ZONE", "format": "raw", "data_format": "markdown"}' \
  https://api.brightdata.com/request
```

Return a screenshot

Web Unlocker is able to take a screenshot of the page you are trying to scrape. This can be useful for debugging or for monitoring the page's appearance.

To activate the feature, add the `x-unblock-data-format: screenshot` header when using the native proxy interface or add `data_format: screenshot` to request body when using API interface.

Output format is `.png`

HTTP API Native proxy interface

```
curl -k https://api.brightdata.com/request \
  -H "Content-Type: application/json" \
  -H "Authorization: Bearer <YOUR API KEY>" \
  -d '{"zone": "unblocker", "url": "https://example.com", "format": "raw", "data_format": "screenshot"}' \
  --silent --output example_com.png
```

Custom Web Unlocker API

Gain enhanced control over your requests with flexible options to fine-tune website behavior and optimize request handling.

By default, Web Unlocker API automatically manages all request headers, cookies, expect elements etc., to get the best known results and any extra elements that are sent along with the request are disregarded.

Custom Web Unlocker API allows you to override the automated parameters and send your own custom values specific to your needs.

Custom features:

[Manual headers & cookies](#)

Web Unlocker API feature you want to use.

Advanced settings ^

☒ **Custom headers & cookies** ⓘ Beta

Send custom headers & cookies along with your requests.

ⓘ With this feature enabled, you'll be charged for all requests, whether successful or failed

Explore our list of pre-approved custom header fields per domain

Choose success rate threshold to start auto-throttling requests ⓘ

Auto throttling will be applied per domain if success rate goes below 70%

Once enabled, you can now send Custom Web Unlocker API requests in accordance with each [custom feature's](#) procedure.

Billing

Unlike the regular Web Unlocker API billing logic, which only charges for successful requests, when any of the above Custom Web Unlocker API features are **enabled**, you'll be billed for 100% of the requests (both successful and failed).

Since you are now in control of certain request parameters, Bright Data can no longer take full responsibility for the unlocking process and its performance.

⚠ Be advised:

We do not allow cookies for login/authentication purposes
Adding custom parameters to your request may result in blocking and a drop in the success rate.

Manual headers & cookies

Override automated headers/cookies and send your own custom values in order to target specific versions of a website.

ⓘ Enabling Custom Headers & Cookies results in the following

Access to Pre-approved List of Headers/Cookies

Send Request for New Headers/Cookies

Charging for All Requests

Manual 'expect' elements

You can configure this per request with the `x-unblock-expect` header seen below.

Add header

Element must exist Page must include text

```
curl -vk \
  -x brd-customer-$CUSTOMER_ID-zone-$ZONE:$PASSWORD@brd.superproxy.io:33335 \
  -H 'x-unblock-expect: {"element": ".some-css-selector"}' \
  https://example.com
```

Amazon-specific geolocation headers

Unlocker API allows you to pass custom headers to simulate a user-selected city and ZIP code on Amazon, enabling access to region-specific content, pricing, and delivery options.

`x-unblock-city` - Simulates selecting a city.

`x-unblock-zipcode` - Simulates selecting a ZIP code on Amazon.

Example

```
curl -vk \
  -x brd-customer-$CUSTOMER_ID-zone-$ZONE:$PASSWORD@brd.superproxy.io:33335 \
  -H 'x-unblock-zipcode: 10001' \
  -H 'x-unblock-city: New York' \
  https://www.amazon.com/
```

Monitor Web Unlocker API Usage

To review your current Web Unlocker API CPM, navigate to [My Proxies](#) page, and review the **Traffic** column.

Proxies & Scraping Infra						
My Proxies Dashboard Event Log Support More						
01/03/2023 - 06/03/2023						
Proxy	Type	Cost/GB	Usage/Spend Limit	Traffic (KB/M...)	Spent	Status
zone3	Web Unlocker	\$3/CPM	No limit	115K reqs	\$345	Active
residential	Residential	\$0/GB	No limit			Inactive
mobile	Mobile	\$0/GB	No limit			Inactive
serp	SERP API		No limit			Inactive
serp2	SERP API		No limit			Inactive
zone1	Data Center	\$0/GB	No limit			Inactive
zonetest1	Residential	\$0/GB	No limit			Inactive

How is usage calculated?

Your Web Unlocker API usage is measured by CPM. CPM is the cost of 1000 **successful requests**, meaning only successful Web Unlocker API requests will count toward your billing.

See our [Billing & Pricing](#) page to learn more.

Debugging Web Unlocker API

Sometimes it's useful to extract some debug info about your requests to understand what happened inside them in more detail.

We provide the `x-brd-debug` header for this purpose.

To activate the headers, add `-debug-full` to your proxy username.

ⓘ This feature is only available for the Unlocker API and is NOT available for our proxy products.

Enabling debug headers in your request

```
curl -vk \
  -x brd-customer-$CUSTOMER_ID-zone-$ZONE-debug-full:$PASSWORD@brd.superproxy.io:33335 \
  https://example.com
```

The format of the `x-brd-debug` header looks like this:

```
req_id=hl_d09913c7_a1lw123bkcg; bytes_up=2842; bytes_down=562418; billed=false; destination_ip=162.219.225.118; used_req_headers=
```

Field	Description
req_id	The internal ID of your request into our system. Providing this can be helpful in bug reports as it will help us see details on what happened in your specific request.
bytes_up	The amount of outgoing traffic our system recorded while processing this request
bytes_down	The amount of incoming traffic our system recorded while processing this request
billed	Whether our system considers this a billable request or not
destination_ip	The IP address of the remote server used to fetch this data
used_req_headers	Which request headers (if any) were used in the final request. This mainly applies when using Custom Web Unlocker API
peer_ip	A unique identifier for the IP address used to make the request. This is mainly useful to validate IP rotation is working as you expect
peer_country	The country of the peer that was used for the request
render	Shows whether the returned page is the result after a browser rendered the HTML or the response body of a single HTTP request

Common Error Codes

Error	Description
404	Page not found. Invalid URL, which suggests the URL might be broken or dead.
403	The URL you're trying to access is valid, but you are forbidden from accessing that URL.
502	Error code <code>502</code> is the most common error for Web Unlocker API users, the descriptive part is under the <code>x-luminati-error-code</code> .
407	This error code suggests one of your account credentials is incorrect (password or zone's name).
429	This error code implies a rate limit (rare). In such cases, if the response appears as below, Bright Data is applying auto-throttling to the request, and you should open a ticket or email support@brightdata.com for assistance.
401 411 444	Bad request, usually happens in API requests when headers or cookies missing.
503	HTTP error code <code>503</code> means "Service Unavailable". Browser check failed or browser check wasn't completed

```
< HTTP/1.1 429 The request was auto-throttled due to low success rate
< x-luminati-error-code: sr_rate_limit
< x-luminati-error: The request was auto-throttled due to low success rate
< x-brd-error-code: sr_rate_limit
< x-brd-error: The request was auto-throttled due to low success rate
< date: Tue, 23 Jan 2024 17:07:19 GMT
< connection: keep-alive
< keep-alive: timeout=5
< transfer-encoding: chunked
<
* Connection #0 to host brd.superproxy.io left intact
```

Contact support for further assistance

Get Success Rate Statistics Per Domain

The following API endpoint will provide Web Unlocker API success rate statistics from the past 7 days.

The statistics can be obtained per single domain like `example.com` or for a wildcard domain like `example.*` in order to get statistics for all top-level domains.

Note: calling this API endpoint requires using your [API key](#)

How to get statistics for a single domain?

RequestResponse

```
curl "https://api.brightdata.com/unblocker/success_rate/example.com" -H "Content-Type: application/json" -H "
```
